Skills

Languages/Subjects: Java, JavaScript(basic), Python(basic), C++, C, Data Structures, Algorithms, Operating System, Database Management System, Software Engineering, Computer Networks, Object Oriented Programming System, AI, ML, HTML, CSS, SQL.

Frameworks/Libraries/Tools: Spring Boot, React.js, Redux, Git/GitHub, GitLab CI/CD, Docker, AWS, TensorFlow.

Database: MySQL(relational), MongoDB(non-relational), PostgreSQL, MongoDB Atlas, Firebase.

Work Experience

Software Engineer Intern, Ailexity **June 2025 – July 2025**

● Developed and deployed a cloud-based plant leaf disease detection web application using CNN, ResNet, and Inception models, enabling real-time disease classification and early crop health diagnosis.

● Integrated deep learning models with a Flask web interface and cloud deployment (Heroku/AWS), allowing users to upload leaf images and receive instant, accurate diagnostic feedback.

Artificial Intelligence & machine learning Intern, Innovate Intern **Sep 2024 – Jan 2025**

● Developed a plant leaf disease detection web application using deep learning models such as CNN, ResNet, and Inception, enabling accurate classification of diseases including powdery mildew, rust, and blight.

● Integrated the trained model with a Flask-based web interface to allow users to upload leaf images and receive real-time disease predictions for early crop diagnosis.

Google AI-ML VIRTUAL INTERNSHIP, Eduskills Foundation **july 2024 – Jan 2025**

- Completed the **Google AI-ML Virtual Internship** conducted by *Google for Developers* in collaboration with *EduSkills Foundation*, focusing on core artificial intelligence and machine learning concepts.
- Gained hands-on experience with neural networks, image classification, object detection, and practical model building using frameworks like TensorFlow and Keras, culminating in a certificate and skill badges.

Projects

Leaf Disease Detection Flask App **Sep 2024 – Jan 2025**

Developed **"Leaf Disease Detection Flask App,"** an AI-powered web platform that identifies plant leaf diseases using deep learning, enabling farmers and agricultural stakeholders to take early preventive actions and reduce crop loss. Built with scalable ML pipelines and an interactive Flask interface for real-time disease diagnosis.

- Implemented advanced Neural Network architectures **CNN, ResNet, and Inception** to improve multi-class disease classification accuracy.
- Trained the model on labeled plant leaf datasets to detect diseases such as **powdery mildew, rust, and blight** with high precision.
- Integrated the trained deep learning model into a **Flask-based web application** enabling real-time image upload and prediction.
- Designed a responsive UI allowing users to upload leaf images and instantly receive diagnostic feedback.
- Applied preprocessing techniques such as image resizing, normalization, and augmentation to enhance model performance.
- Deployed the application on **cloud platforms (Heroku/AWS)** ensuring global accessibility and scalability.
- Promotes sustainable agriculture by enabling rapid disease detection and minimizing pesticide misuse.

Technologies Used: Python, Flask, TensorFlow, Keras, CNN, ResNet, Inception, OpenCV, HTML, CSS, JavaScript, Cloud Deployment (Heroku/AWS)

AgriBid – Digital Agricultural Bidding Marketplace **Jan 2023 – Feb 2023**

Developed **"AgriBid,"** a digital agricultural marketplace that connects farmers with licensed merchants through a transparent bidding ecosystem, improving price discovery and ensuring fair agricultural trade. Designed with secure verification systems and location-aware transaction workflows.

- Built a **transparent bidding system** where merchants place competitive bids after inspecting product quality.
- Implemented **time-scheduled bidding cycles** based on product expiration periods to ensure fair pricing and reduce wastage.
- Developed backend services using **Java (Spring Boot)** for bid management, merchant verification, and transaction handling.
- Designed RESTful APIs for communication between frontend marketplace modules and backend services.
- Integrated **proximity-based notification algorithms** to alert nearby merchants about available farmer listings.
- Enabled farmers to consult **licensed agricultural doctors** via the platform for crop health and yield optimization.
- Implemented secure authentication and role-based access for farmers and merchants.
- Promotes rural employment, transparent trade practices, and sustainable agricultural commerce.

Technologies Used: HTML, CSS, JavaScript, **Java, Spring Boot**, Python, Flask, SQL/Database, Location APIs, REST APIs

Licenses & certifications

- Introduction to Computers and Operating Systems and Security **- Coursera** **Dec – 2023**
- Computational Thinking for Problem Solving - **Coursera** **Dec- 2023**
- c++ programming – **Cisco Networking Academy** **Apr- 2024**
- Design and Analysis of Algorithms - **NPTEL** **July –Sep 2025**

Education

MIT ADT University, PUNE, India **2023 - 2027**

- B Tech – Computer Science and Engineering - **CGPA: 7.54**

CHAMPAVATI, JUNIOR COLLEGE, CHAPANER, CHH. SAMBHAJINAGAR **2022 - 2023**

- Maharashtra State Board of Secondary & Higher Secondary Education | Percentage: 65.33%

SANE GURUJI VIDHYALAYA, KANNAD, CHH. SAMBHAJINAGAR **2020-2021**

- Maharashtra State Board of Secondary & Higher Secondary Education | Percentage: 89%
